1. PRINCIPLE OF OPERATION

06102B

Printed copies are Uncontrolled

1.1.1. PRINCIPLE OF PHOTOLYTIC O₃ GENERATION

Ozone is a naturally occurring substance that is sometimes called "activated oxygen". It contains three atoms of oxygen (O₃) instead of the usual two found in normal oxygen (O₂) that is essential for life. Because of its relatively short half-life, ozone cannot be bottled and stored for later use and therefore must always be generated on-site by an ozone generator. The two main principles of ozone generation are UV-light and corona discharge. While the corona-discharge method is most common because of its ability to generate very high concentrations (up to 50%), it is inappropriate for calibration needs since the level of fine control over the O₃ concentration is poor. Also, the corona discharge method produces a small amount of NO₂ as a byproduct, which also may be undesirable in a calibration application.

The UV-light method is most feasible in calibration application where production of low, accurate concentrations of ozone desired. This method mimics the radiation method that occurs naturally from the sun in the upper atmosphere producing the ozone layer. An ultra-violet lamp inside the generator emits a precise wavelength of UV Light (185nm). Ambient air is passed over an ultraviolet lamp, which splits some of the molecular oxygen (O₂) in the gas into individual oxygen atoms which attach to other existing oxygen molecules (O₂), forming ozone (O₃).

Figure 1-1: O₃ Generator Internal Pneumatics

1.1.2. GENERATOR PNEUMATIC OPERATION

The rate of flow through the O₃ generator is controlled by a flow control assembly located on the Regulator Sub-Assembly in the front of the M703E.

Figure 1-2: O₃ Generator Valve and Gas Fixture Locations

1.1.3. O₃ GENERATOR ELECTRONIC OPERATION

Electronically the O₃ generator and its subcomponents act as peripheral devices operated by the CPU via the motherboard. Sensor signals, such as the UV lamp thermistor are routed to the motherboard, where they are digitized. Digital data is sent by the motherboard to the calibrator's CPU and where required stored in either flash memory or on the CPU's disk-on-chip. Commands from the CPU are sent to the motherboard and forwarded to the various devices via the calibrator's I²C bus.

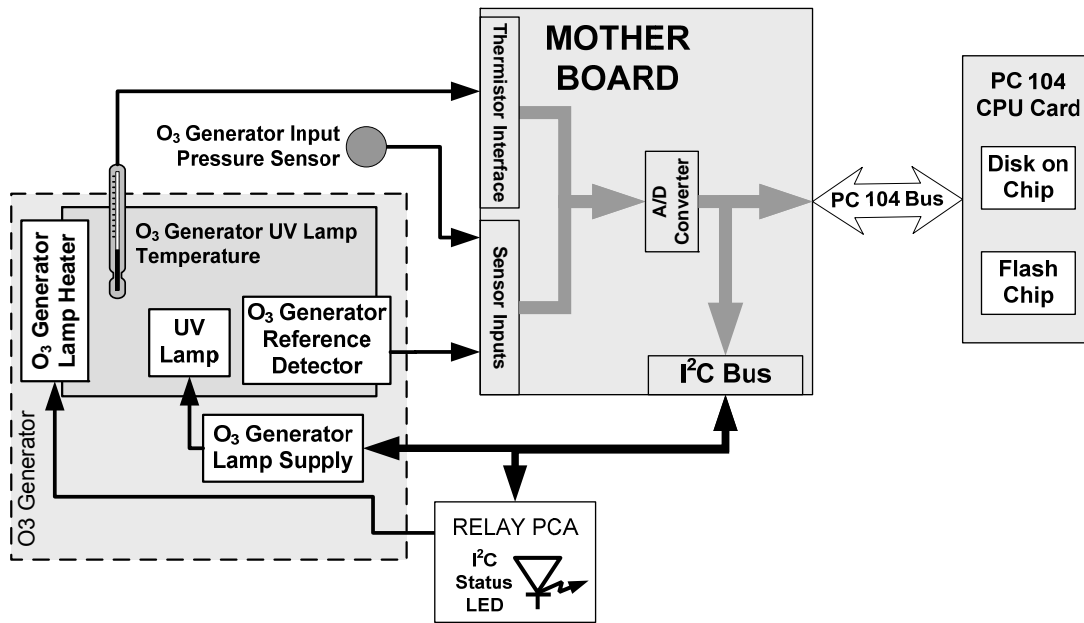

Figure 1-3: O₃ Generator Electronic Block Diagram

Figure 1-4: O₃ Generator Electronic Components Location

1.1.3.1. O₃ GENERATOR TEMPERATURE CONTROL

In order to operate at peak efficiency the UV lamp of the M703E's O₃ generator is maintained at a constant 48°C. If the lamp temperature falls below 43°C or rises above 53°C a warning is issued by the calibrator's CPU.

This temperature is controlled using a thermistor, a heater, and a relay. The location of the thermistor and heater associated with the O₃ generator is shown below:

Figure 1-5: O₃ Generator Temperature Thermistor and DC Heater Locations

1.2. PHOTOMETER OPERATION

The Model M703E calibrator's photometer determines the concentration of Ozone (O_3) in a sample gas drawn through it. Sample and calibration gasses must be supplied at ambient atmospheric pressure in order to establish a stable gas flow through the absorption tube where the gas' ability to absorb ultraviolet (UV) radiation of a certain wavelength (in this case 254nm) is measured.

Gas bearing O_3 and zero air are alternately routed through the photometer's absorption tube. Measurements of the UV light passing through the sample gas with and without O_3 present are made and recorded.

Calibration of the photometer is performed in software and does not require physical adjustments. Two internal variables, a slope and offset are used to adjust the calibration of the photometer.

The CPU uses these calibration values, the UV absorption measurements made on the sample gas in the absorption tube along with data regarding the current temperature and pressure of the gas to calculate a final O_3 concentration.

1.2.1. MEASUREMENT METHOD

1.2.1.1. CALCULATING O_3 CONCENTRATION

The basic principle by which photometer works is called Beer's Law (also referred to as the Beer-Lambert equation). It defines the how light of a specific wavelength is absorbed by a particular gas molecule over a certain distance at a given temperature and pressure. The mathematical relationship between these three parameters for gasses at Standard Temperature and Pressure (STP) is:

Equation 1-1

$$I = I_0 e^{-\alpha LC} \quad \text{at STP}$$

Where:

I_0 is the intensity of the light if there was no absorption.

I is the intensity with absorption.

L is the absorption path, or the distance the light travels as it is being absorbed.

C is the concentration of the absorbing gas. In the case of the Model 703E, Ozone (O_3).

α is the absorption coefficient that tells how well O_3 absorbs light at the specific wavelength of interest.

To solve this equation for C , the concentration of the absorbing Gas (in this case O_3), the application of a little algebra is required to rearrange the equation as follows:

Equation 1-2

$$C = \ln\left(\frac{I_o}{I}\right) \times \left(\frac{1}{\alpha L}\right) \text{ at STP}$$

Unfortunately, both ambient temperature and pressure influence the density of the sample gas and therefore the number of ozone molecules present in the absorption tube thus changing the amount of light absorbed. In order to account for this effect the following addition is made to the equation:

Equation 1-3

$$C = \ln\left(\frac{I_o}{I}\right) \times \left(\frac{1}{\alpha L}\right) \times \left(\frac{T}{273^\circ\text{K}} \times \frac{29.92\text{inHg}}{P}\right)$$

Where:

T = sample ambient temperature in degrees Kelvin

P = ambient pressure in inches of mercury

Finally, to convert the result into Parts per Billion (PPB), the following change is made:

Equation 1-4

$$C = \ln\left(\frac{I_o}{I}\right) \times \left(\frac{10^9}{\alpha L}\right) \times \left(\frac{T}{273^\circ\text{K}} \times \frac{29.92\text{inHg}}{P}\right)$$

In a nutshell the M703E photometer:

- Measures each of the above variables: ambient temperature; ambient gas pressure; the intensity of the UV light beam with and without O₃ present;
- Inserts know values for the length of the absorption path and the absorption coefficient, and;
- Calculates the concentration of O₃ present in the sample gas.

1.2.1.2. THE MEASUREMENT / REFERENCE CYCLE

In order to solve the Beer-Lambert equation it is necessary to know the intensity of the light passing through the absorption path both when O₃ is present and when it is not. A valve called the measure/reference valve, physically located on front-left corner of the O₃ generator assembly alternates the gas stream flowing to the photometer between zero air (diluent gas) and the O₃ output from the O₃ generator. This cycle takes about 6 seconds.

Table 1-1: M703E Photometer Measurement / Reference Cycle

TIME INDEX	STATUS
0 sec.	Measure/Reference Valve Opens to the Measure Path.
0 – 2 sec.	Wait Period. Ensures that the Absorption tube has been adequately flushed of any previously present gasses.
2 – 3 Seconds	Analyzer measures the average UV light intensity of O ₃ bearing Sample Gas (I) during this period.
3 sec.	Measure/Reference Valve Opens to the Reference Path.
3 – 5 sec.	Wait Period. Ensures that the Absorption tube has been adequately flushed of O ₃ bearing gas.
5 – 6 Seconds	Analyzer measures the average UV light intensity of Non-O ₃ bearing Sample Gas (I ₀) during this period.
CYCLE REPEAT EVERY 6 SECONDS	

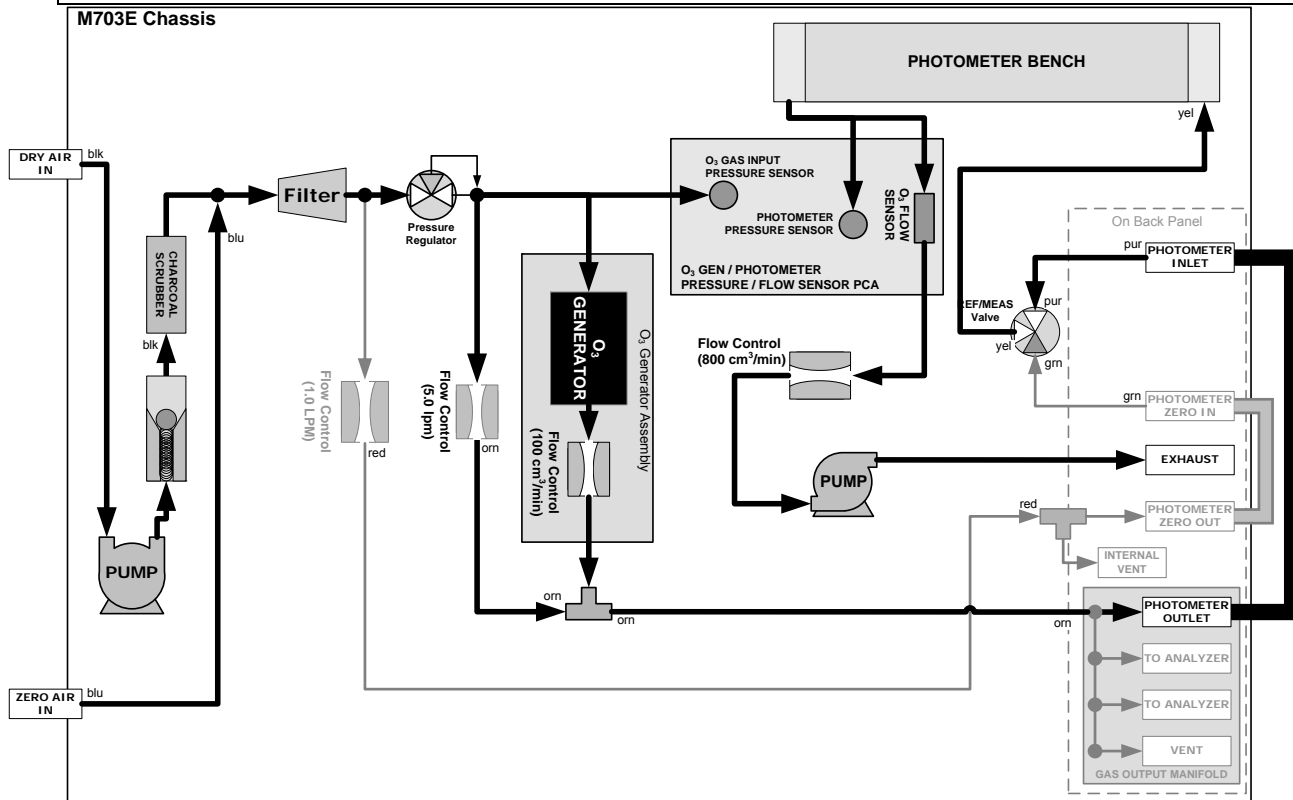

Figure 1-6: O₃ Photometer Gas Flow – Measure Cycle

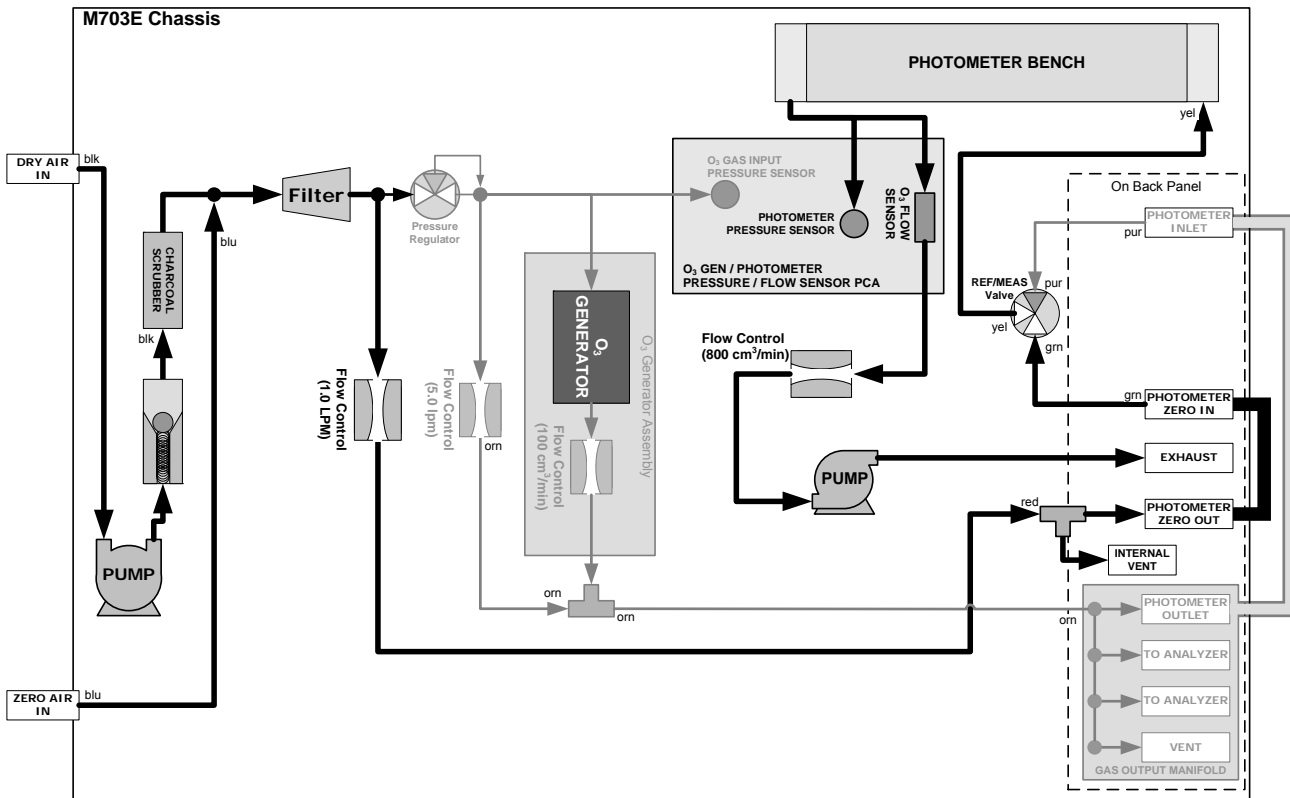

Figure 1-7: O₃ Photometer Gas Flow – Reference Cycle

1.2.1.3. THE ABSORPTION PATH

In the most basic terms, the M703E photometer uses a high energy, mercury vapor lamp to generate a beam of UV light. This beam passes through a window of material specifically chosen to be both non-reactive to O₃ and transparent to UV radiation at 254nm and into an absorption tube filled with sample gas. Because ozone is a very efficient absorber of UV radiation the absorption path length required to create a measurable decrease in UV intensity is short enough (approximately 42cm) that the light beam is only required to make one pass through the absorption tube. Therefore, no complex mirror system is needed to lengthen the effective path by bouncing the beam back and forth.

Finally, the UV passes through a similar window at the other end of the absorption tube and is detected by a specially designed vacuum diode that only detects radiation at or very near a wavelength of 254nm. The specificity of the detector is high enough that no extra optical filtering of the UV light is needed. The detector reacts to the UV light and outputs a current signal that varies in direct relationship with the intensity of the light shining on it. This current signal is amplified and converted to a 0 to 5 volt analog signal is sent to the instrument's motherboard where it is digitized. The CPU uses this data in computing the concentration of O₃ in the absorption tube.

Figure 1-8: O₃ Photometer Absorption Path

1.2.2. PHOTOMETER LAYOUT

The photometer is where the absorption of UV light by ozone is measured and converted into a voltage. It consists of several sub-assemblies:

- A mercury-vapor UV lamp. This lamp is coated in a material that optically screens the UV radiation output to remove the O_3 producing 185nm radiation. Only light at 254nm is emitted.
- An AC power supply that supplies the current for starting and maintaining the plasma arc of the mercury vapor lamp.
- A thermistor and DC heater attached to the UV Lamp to maintain the lamp at an optimum operating temperature.
- 42cm long quartz absorption tube.
- A thermistor attached to the quartz tube for measuring sample gas temperature.
- Gas inlet and outlet mounting blocks that rout sample gas into and out of the photometer.
- The vacuum diode, UV detector that converts UV light to a DC current.
- A preamplifier assembly, which convert the detector's current output into a DC voltage then amplifies it to a level readable by the A to D converter circuitry of the instrument's motherboard
-

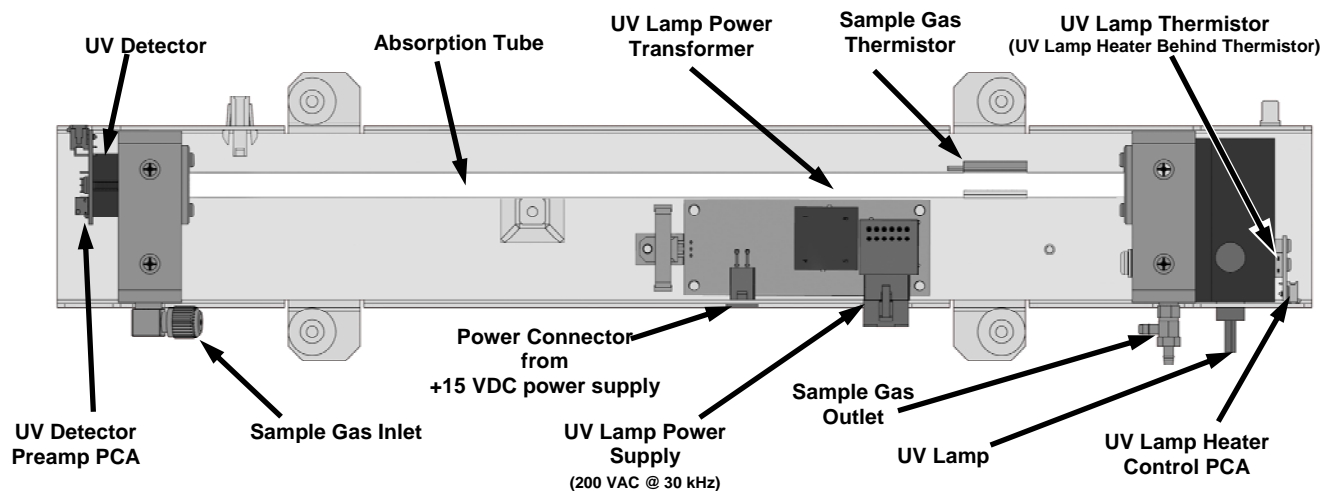

Figure 1-9: O_3 Photometer Layout – Top Cover Removed

1.2.3. PHOTOMETER PNEUMATIC OPERATION

The flow of gas through the photometer is created by a small internal pump that pulls air through the instrument. There are several advantages to this “pull through” configuration. Placing the pump downstream from the absorption tube avoids problems caused by the pumping process heating and compressing the sample.

In order to accurately measure the presence of low concentrations of O_3 in the sample air, it is necessary to establish and maintain a relatively constant and stable volumetric flow of sample gas through the

photometer. The simplest way to accomplish this is by placing a flow control assembly containing a critical flow orifice directly upstream of the pump but down stream from the absorption tube.

The critical flow orifice installed in the pump supply line is tuned to create a gas flow of 800 cm³/min. A pressure sensor and a flow sensor, located on the O₃ generator / photometer pressure flow sensor PCA, monitor the pressure and flow rate of the gas passing through the photometer's absorption tube.

1.2.4. PHOTOMETER ELECTRONIC OPERATION

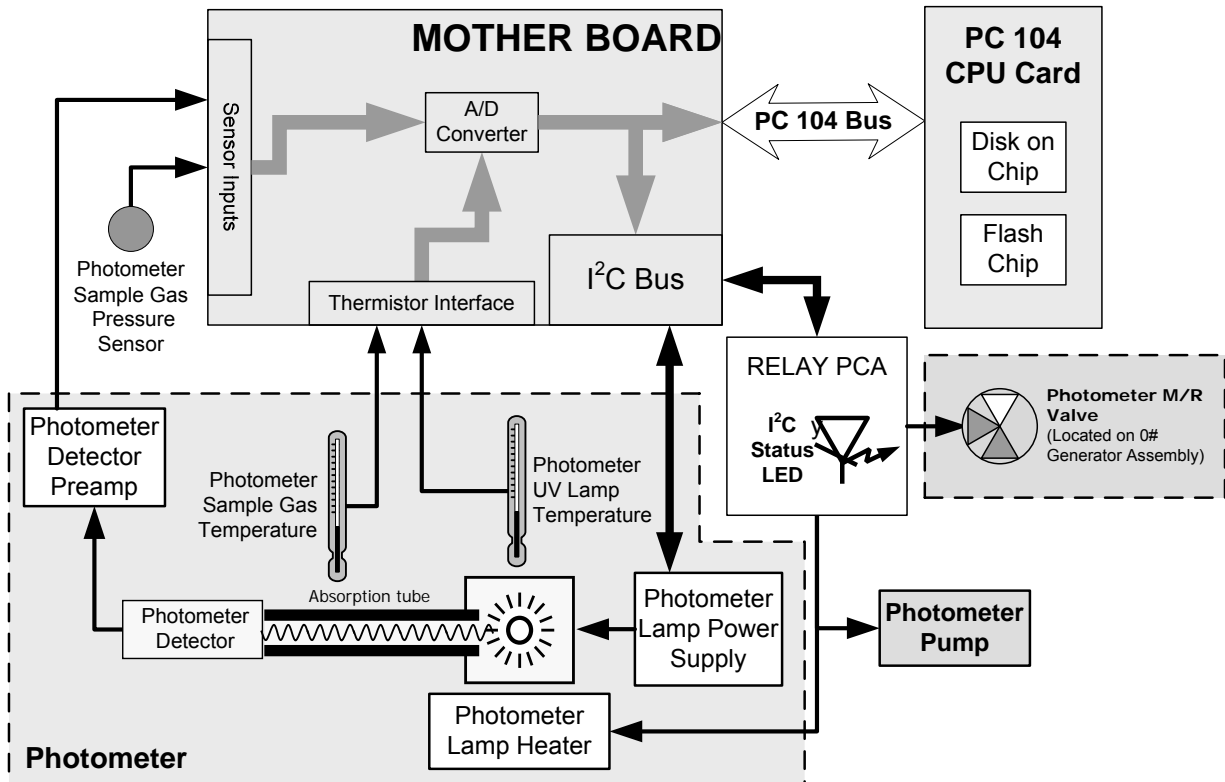

Figure 1-11: O₃ Photometer Electronic Block Diagram

Like the O₃ generator, the O₃ photometer and its subcomponents act as peripheral devices operated by the CPU via the motherboard. Communications to and from the CPU are handled by the motherboard.

Outgoing commands for the various devices such as the photometer pump, the UV lamp power supply, and the UV Lamp heater are issued via the I²C bus to circuitry on the relay PCA which turns them ON/OFF. The CPU also issues commands over the I²C bus that cause the relay PCA to cycle the measure/reference valve back and forth.

Data from the UV light detector is amplified locally then converted to digital information by the motherboard. Output from the photometer's temperature sensors are also amplified and converted to digital data by the motherboard. The O₃ concentration of the sample gas is computed by the CPU using this data (along with gas pressure and flow data received from the M703E's pressure sensors).

1.2.4.1. O₃ PHOTOMETER TEMPERATURE CONTROL

In order to operate at peak efficiency, the UV lamp of the M703E's O₃ photometer is maintained at a constant 58°C. This is intentionally set at a temperature higher than the ambient temperature of the M703E's operating environment to make sure that local changes in temperature do not affect the UV Lamp. If the lamp temperature falls below 56°C or rises above 61°C a warning is issued by the calibrator's CPU.

The following TEST functions report these temperatures and are viewable from the instrument's front panel:

- **PHOTO LAMP TEMP** - The temperature of the UV Lamp reported in °C.
- **PHOTO STEMP** - The temperature of the sample gas in the absorption tube reported in °C.

1.2.4.2. PNEUMATIC SENSORS FOR THE O₃ PHOTOMETER

The several sensors located on the pneumatic sensor just to the left rear of the O₃ generator assembly measure the absolute pressure and the flow rate of gas inside the photometer's absorption tube. This information is used by the CPU to calculate the O₃ concentration of the sample gas. Both of these measurements are made downstream from the absorption tube but upstream of the pump. A critical flow orifice located between the flow sensor and the pump maintains the gas flow through the photometer at 800 cm³/min.

The following TEST functions are viewable from the instrument's front panel:

- **PHOTO FLOW** - The flow rate of gas through the photometer measured in cc/min.
- **PHOTO SPRESS** – the pressure of the gas inside the absorption tube. This pressure is reported in inches of mercury-absolute (**in-Hg-A**), i.e. referenced to a vacuum (zero absolute pressure). This is not the same as **PSIG**.

USER NOTES:

06102B

Printed copies are Uncontrolled

4. QUICK CALIBRATION

06102B

Printed copies are Uncontrolled

4.1 ANALOG CALIBRATION

1. From the Main Menu press [SETUP] [MORE] [DIAG] [929] [ENTR] [NEXT] [ANALOG I/O CONFIGURATION] [ENTER] [CAL]. This will calibrate all of the analog outputs.
2. From the Main Menu press [SETUP] [MORE] [DIAG] [929] [ENTR] [NEXT] [ANALOG I/O CONFIGURATION] [ENTER] [SET>] [AIN CALIBRATED] [CAL]. This will calibrate the Analog Inputs.
3. This calibration should always be done AUTOMATICALLY never MANUALLY.

4.2 PRESSURE/FLOW CALIBRATIONS

4.2.3 REGULATOR PRESSURE CALIBRATION

1. Disconnect the 1/8" cap on the PRESSURE REGULATOR and attach a pressure gauge to this port.
2. Press [SETUP] [MORE] [DIAG] [929] [ENTER].
3. Press [NEXT] until the top line reads PRESSURE CALIBRATION press [ENTER].
4. Adjust the screw on the REGULATOR until the pressure gauge reads the Maximum PSI, record this pressure.
5. Leave every pressure except the O₃ pressure setting the same.
6. Set the O₃ REGULATOR pressure setting to the pressure recorded in step 4 and press [ENTER].
7. Disconnect the pressure gauge and reinstall the 1/8" cap.

4.2.4 PHOTO PRESSURE CALIBRATION

1. Find the current local ambient pressure in inches of mercury, from either a local weather station or a calibrated barometer.
2. Press [SETUP] [MORE] [DIAG] [929] [ENTER].
3. Press [NEXT] until the top line reads PRESSURE CALIBRATION press [ENTER].
4. Leave every pressure except the SAMPLE pressure setting the same.
5. Set the SAMPLE pressure setting to the current local ambient pressure and press [ENTER]

4.2.5 PHOTO FLOW CALIBRATION

1. Generate Oppb of O₃.
2. Remove the sample fitting on the O₃ bench and measure the O₃ flow going into the Teflon Elbow.
3. This flow rate should be 800cc/min ±80cc's. Reconnect the sample fitting.
4. Now put the calibrator into STANDBY.
5. Press [SETUP] [MORE] [DIAG] [929] [ENTER]. Press [NEXT] until the top line reads FLOW CALIBRATION press [ENTER]
6. Enter the measured flow in step 2 above. Press [ENTER].
7. EXIT out to the main menu and generate Oppb of ozone.
8. Press the <TST TST> buttons until the top line reads PHOTO FLOW. This should read the measure value that was entered in step 2
9. The calibration is complete.
10. EXIT back out to the Main Menu and ensure that the flow is correct.

4.3 OZONE CALIBRATIONS

4.3.1 REFERENCE ADJUSTMENT

1. Put the calibrator into STANDBY.
2. Press [SETUP] [O3] [ADJ].
3. Press the <TST TST> buttons until O3 GEN DRIVE, this value should be 2500mv.
4. Press the <TST TST> buttons until O3 GEN REF, this value should be 2500mv \pm 200mv. If it is not you will need to peak the UV LAMP and adjust the reference detector potentiometer VR1 until the value is within specifications.
5. Exit back to the Main Menu.

4.3.2 BENCH CALIBRATION

1. The calibrator must be in STANDBY mode.
2. Press [SETUP] [O3] [PHOT] [BCAL] [717] [ENTER] [CAL] [ZERO] [ENTER], wait 30 minutes until you have a good stable zero reading on your photometer and then press [ZERO] [YES], the Zero has now been calibrated. Press [EXIT] one time.
3. Press [CAL] [SPAN] [ENTER]
4. Select your target concentration and press [ENTER] and wait 30 minutes for the photometer become stable.
5. Press [SPAN], enter the amount of ozone read by your photometer and then press [ENTER] [YES].
6. The internal photometer reading should now match your external photometer reading.
7. Exit back to the Main Menu.

4.4.3 IZS CALIBRATION

1. Press [SETUP] [MORE] [DIAG] [929] [NEXT] until the top line reads O3 GEN CALIBRATION.
2. Press [ENTER] [CAL]
3. This procedure will be performed automatically and take 1 hour to complete.
4. Once the calibration has been completed exit back out to the main menu.

4.5 USING THE M703E AS A PHOTOMETER

4.5.1 The M703E will normally generate its own ozone levels and read that, adjusting for the proper concentration requested. However; there is a new feature that allows you to use the M703E as a photometer, monitoring external ozone concentrations.

To do this simply remove the two U shaped tubing jumpers on the back of the calibrator. You will now plumb your ozone to the "PHOTOMETER INLET" (Measure) and your Zero Air to the "PHOTO ZERO INLET" (Reference). Make sure that both of these are at ambient pressure use a vent to ensure that these are at ambient.

Once this has been plumbed up simply hit [GEN] [AUTO] [0ppb O3]. The calibrator will now act as though it is generating ozone except it will be pulling gas from the outside of the calibrator. From the front panel press the <TST TST> buttons until the top line reads ACT=, this will be displaying the current ozone concentration

USER NOTES:

USER NOTES:

06102B

Printed copies are Uncontrolled

6. LEAK CHECKING

06102B

Printed copies are Uncontrolled

6.1 PERFORMING LEAK CHECKS

6.1.1 PRESSURE LEAK CHECK

Obtain a leak checker similar to the Teledyne Instruments' part number 01960, which contains a small pump, shut-off valve and pressure gauge. Alternatively, a tank of pressurized gas, with the two-stage regulator adjusted to ≤ 15 psi, a shutoff valve and pressure gauge may be used.

	<p style="text-align: center;">CAUTION</p> <p style="text-align: center;">Once the fittings have been wetted with soap solution, do not apply a vacuum as this will cause soap solution to be drawn into the instrument, contaminating it.</p> <p style="text-align: center;">DO NOT EXCEED 15 PSI PRESSURE.</p>
---	---

1. Turn OFF power to the calibrator.
2. Remove the instrument cover
3. Install a leak checker or tank of gas as described above on the "dry air in" port at the rear panel.
4. Install caps on the following fittings on the rear panel.
 - Exhaust
 - Vent
 - Internal Vent
 - Zero
 - Air Inlet
 - Both CALGAS OUT fittings

NOTE

The M703E calibrator cannot be leak checked with the pump in line due to internal leakage that normally occurs in the pump.

5. Locate the dry air pump.
6. Disconnect the two fittings on the dry air pump and install a union fitting in place of the pump.
7. Locate the photometer pump.
8. Disconnect the two fittings on the photometer pump and install a union fitting in place of the pump.

9. Pressurize the calibrator with the leak checker, allowing enough time to pressurize the instrument fully.
10. Check each fitting with soap bubble solution, looking for bubbles.
 - Once the fittings have been wetted with soap solution.
 - Do not re-apply vacuum as it will draw soap solution into the instrument and contaminate it.
 - Do not exceed 15 psi pressure.
11. Once the leak has been located and repaired, the leak-down rate should be < 1 in-Hg (0.4 psi) in 5 minutes after the pressure is shut off.

O3 GEN DRIVE	<p>Check the O₃ generator heater and temperature sensors</p> <p>Possible causes of faults are the same as O3 GEN LAMP TEMP WARNING from Table 8-6</p>
O3 LAMP TEMP	<p>Incorrect lamp temperature can affect the efficiency and durability of the O₃ generators UV lamp.</p> <p>Possible causes of faults are the same as O3 GEN LAMP TEMP WARNING from Table 8-6</p>
REG PRESSURE	Same as REGULATOR PRESSURE WARNING from Table 8-6
BOX TEMP	<p>If the Box Temperature is out of range, make sure that the: Box Temperature typically runs ~7°C warmer than ambient temperature.</p> <ul style="list-style-type: none"> - The Exhaust-Fan is running - There is sufficient open space to the side and rear of instrument to allow adequate ventilation.
PHOTO MEASURE & PHOTO REFERENCE	<p>If the value displayed is too high the UV Source has become brighter. Adjust the variable gain potentiometer on the UV Preamp Board in the optical bench.</p> <p>If the value displayed is too low:</p> <ul style="list-style-type: none"> - < 100mV – Bad UV lamp or UV lamp power supply. - < 2000mV – Lamp output has dropped, adjust UV Preamp Board or replace lamp. <p>If the value displayed is constantly changing:</p> <ul style="list-style-type: none"> - Bad UV lamp. - Defective UV lamp power supply. - Failed I²C Bus. <p>▪ If the PHOTO REFERENCE value changes by more than 10mV between zero and span gas:</p> <ul style="list-style-type: none"> - Defective/leaking switching valve.
PHOTO FLOW	<p>Gas flow problems directly affect the accuracy of the photometer measurements and therefore the concentration accuracy of cal gas mixtures involving O₃ and GPT mixtures.</p> <ul style="list-style-type: none"> - Check for Gas Flow problems.

TEST FUNCTION	DIAGNOSTIC RELEVANCE AND CAUSES OF FAULT CONDITIONS.
PHOTO LAMP TEMP	Poor photometer temp control can cause instrument noise, stability and drift. Temperatures outside of the specified range or oscillating temperatures are cause for concern. Possible causes of faults are the same as PHOTO LAMP TEMP WARNING from Table 8-6
PHOTO SPRESS	The pressure of the gas in the photometer's sample chamber is used to calculate the concentration of O ₃ in the gas stream. Incorrect sample pressure can cause inaccurate readings. - Check for Gas Flow problems. See Section Table 8-6.
PHOTO STEMP	The temperature of the gas in the photometer's sample chamber is used to calculate the concentration of O ₃ in the gas stream. Incorrect sample temperature can cause inaccurate readings. Possible causes of faults are: - Bad bench lamp heater - Failed sample temperature sensor - Failed relay controlling the bench heater - Failed Relay PCA - I ² C Bus malfunction - Hot Lamp
PHOTO SLOPE	Values outside range indicate: <ul style="list-style-type: none"> ▪ Contamination of the Zero Air or Span Gas supply. ▪ Instrument is miss-calibrated. ▪ Blocked Gas Flow. ▪ Faulty Sample Pressure Sensor or circuitry. ▪ Bad/incorrect Span Gas concentration.
PHOTO OFFSET	Values outside range indicate: <ul style="list-style-type: none"> ▪ Contamination of the Zero Air supply.
TIME	Time of Day clock is too fast or slow. <ul style="list-style-type: none"> ▪ Battery in clock chip on CPU board may be dead.

11. T SERIES ADDENDUM

Front panel, rear panel, and display

Getting Started

This section introduces you to the instrument components of the front and rear panel, which are unique to the T series analyzers.

Front Panel

Figure 11-1 shows the analyzer's front panel layout, followed by a close-up of the display screen in Figure 11-2, which is described in Table 11-1. The two USB ports on the front panel are provided for the connection of peripheral devices:

- plug-in mouse (not included) to be used as an alternative to the touchscreen interface
- thumb drive (not included) to upload new versions of software (contact T-API Customer Service for information).
- plug-in keyboard (not included) to reach the touchscreen display calibration menu

Figure 11-1: Front Panel Layout

Figure 11-2: Display Screen and Touch Control

The front panel liquid crystal display screen includes touch control. Upon analyzer start-up, the screen shows a splash screen and other initialization indicators before the main display appears, similar to Figure 9-2 above (may or may not display a Fault alarm). The lights on the display screen indicate the Sample, Calibration and Fault states; also on the screen is the gas concentration field (Conc), which displays real-time readouts for the primary gas and for the secondary gas if installed. The display screen also shows what mode the analyzer is currently in, as well as messages and data (Param). Along the bottom of the screen is a row of touch control buttons; only those that are currently applicable will have a label. Table 11-1 provides detailed information for each component of the screen.

ATTENTION

COULD DAMAGE INSTRUMENT

Do not use hard-surfaced instruments, such as pens, to touch the control buttons.

Table 11-1: Display Screen and Touch Control Description

Field	Description/Function			
Status	Lights indicating the states of Sample, Calibration and Fault, as follows:			
	Name	Color	State	Definition
	SAMPLE	Green	Off	Unit is not operating in sample mode, DAS is disabled.
			On	Sample Mode active; Front Panel Display being updated; DAS data being stored.
			Blinking	Unit is operating in sample mode, front panel display being updated, DAS hold-off mode is ON, DAS disabled
CAL	Yellow	Off	Auto Cal disabled	
		On	Auto Cal enabled	
		Blinking	Unit is in calibration mode	
FAULT	Red	Off	No warnings exist	
		Blinking	Warnings exist	
Conc	Displays the actual concentration of the sample gas currently being measured by the analyzer in the currently selected units of measure			
Mode	Displays the name of the analyzer's current operating mode			
Param	Displays a variety of informational messages such as warning messages, operational data, test function values and response messages during interactive tasks.			
Control Buttons	Displays dynamic, context sensitive labels on each button, which is blank when inactive until applicable.			

Figure 11-3 shows how the front panel display is mapped to the menu charts illustrated in this manual. The Mode, Param (parameters), and Conc (gas concentration) fields in the display screen are represented across the top row of each menu chart. The eight touch control buttons along the bottom of the display screen are represented in the bottom row of each menu chart.

Display Example:

Figure 9-3: Display/Touch Control Screen Mapped to Menu Charts

Front Panel/Display Interface

Users can input data and receive information directly through the front panel touch-screen display. The LCD display is controlled directly by the CPU board. The touchscreen is interfaced to the CPU by means of a touchscreen controller that connects to the CPU via the internal USB bus and emulates a computer mouse.

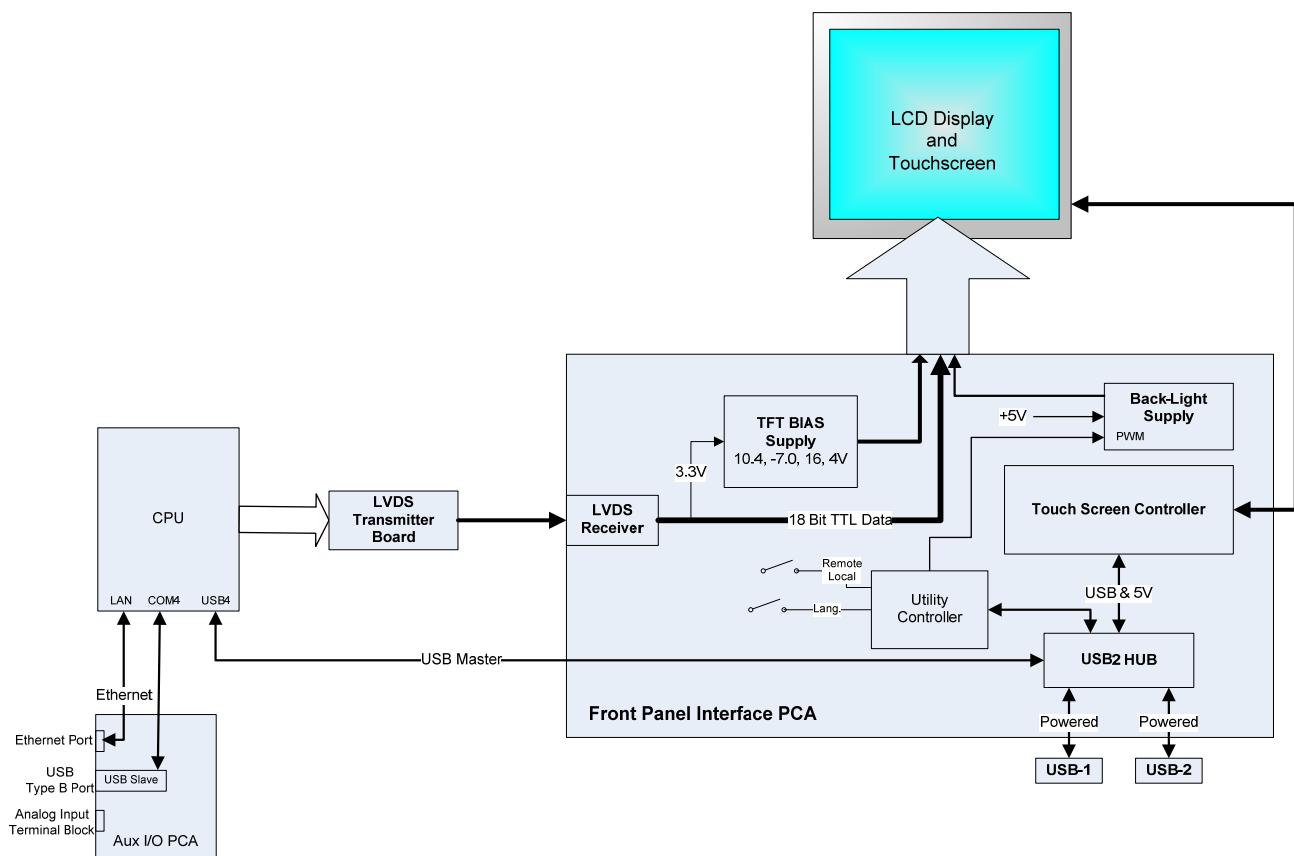

Figure 11-4: Front Panel and Display Interface Block Diagram

LVDS Transmitter Board

The LVDS (low voltage differential signaling) transmitter board converts the parallel display bus to a serialized, low voltage, differential signal bus in order to transmit the video signal to the LCD interface PCA.

Front Panel Interface PCA

The front panel interface PCA controls the various functions of the display and touchscreen. For driving the display it provides connection between the CPU video controller and the LCD display module. This PCA also contains:

- power supply circuitry for the LCD display module
- a USB hub that is used for communications with the touchscreen controller and the two front panel USB device ports
- the circuitry for powering the display backlight (current driven)

Rear panel

Figure 11-5: Rear Panel Layout

Table 11-2 provides a description of new components on the rear panel.

Table 11-2: Rear Panel Description

Component	Function
ANALOG IN	Option for external voltage signals from other instrumentation and for logging these signals
USB	Connector for direct connection to personal computer, using USB cable.

Connecting Analog Inputs (Option)

The Analog In connector is used for connecting external voltage signals from other instrumentation (such as meteorological instruments) and for logging these signals in the analyzer’s internal DAS. The input voltage range for each analog input is 0-10 VDC.

Figure 11-6: Analog In Connector

Pin assignments for the Analog In connector are presented in Table 11-3.

Table 11-3: Analog Input Pin Assignments

PIN	DESCRIPTION	DAS PARAMETER ¹
1	Analog input # 1	AIN 1
2	Analog input # 2	AIN 2
3	Analog input # 3	AIN 3
4	Analog input # 4	AIN 4
5	Analog input # 5	AIN 5
6	Analog input # 6	AIN 6
7	Analog input # 7	AIN 7
8	Analog input # 8	AIN 8
GND	Analog input Ground	N/A

USB Connection (Option)

For direct communication between the analyzer and a PC, connect a USB cable between the analyzer and desktop or laptop USB ports. (If this option is installed, the **COM2** port can only be used for Multidrop communication). The baud rate of the PC and the analyzer must match.

Calibration & update procedures

Display Calibration

The touchscreen display for the T series analyzer can be calibrated for the user’s individual touch. To calibrate the display, you will need a USB keyboard. With the keyboard plugged into either USB port on the front panel, power off the instrument and then re-power.

A Teledyne logo will appear and flash, wait until a logo appears again with the words **System Booting** and a loading bar appear below the logo, and hold down the left shift and left control key on the keyboard throughout the rest of the boot up. This may take several minutes to reach the destination screen.

Once the screen becomes solid blue and a mouse cursor appears on the center of the display, release the left shift and left control keys. A red and white target will appear near the center of the screen. Press the target to start the calibration. The target will now appear in a different location. Press and hold each target following the instructions on the display until you are asked to hit either ACCEPT or CANCEL. Hit accept to accept the changes or cancel to decline the changes. After you hit accept, remove the keyboard and re-power the instrument.

Analog Input Calibration

Analog I/O Configuration for Analog In

Table 11-4: DIAG - Analog I/O Functions (Example functions for a T100, AOUTS may vary)

SUB MENU	FUNCTION
AOUTS CALIBRATED:	Shows the status of the analog output calibration (YES/NO) and initiates a calibration of all analog output channels.
CONC_OUT_1	Sets the basic electronic configuration of the A1 analog output (SO ₂). There are three options: <ul style="list-style-type: none"> RANGE: Selects the signal type (voltage or current loop) and full scale level of the output. REC_OFS: Allows setting a voltage offset, not available when RANGE is set to Current Loop (CURR). AUTO_CAL: Performs the same calibration as AOUT CALIBRATED, but on this one channel only. NOTE: Any change to RANGE or REC_OFS requires recalibration of this output.
CONC_OUT_2	Same as for CONC_OUT_1 but for analog channel 2 (SO ₂)
TEST OUTPUT	Same as for CONC_OUT_1 but for analog channel 4 (TEST)
CONC_OUT_3	(Not available in the analyzer’s standard configuration; applies when optional sensor installed).
AIN CALIBRATED	Shows the calibration status (YES/NO) and initiates a calibration of the analog input channels.
XIN1 . . . XIN8	For each of 8 external analog inputs channels, shows the gain, offset, engineering units, and whether the channel is to show up as a Test function.

AIN Calibration

This is the sub-menu to conduct the analog input calibration. This calibration should only be necessary after major repair such as a replacement of CPU, motherboard or power supplies. Navigate to the **ANALOG I/O CONFIGURATION MENU** from the DIAG Menu, then press:

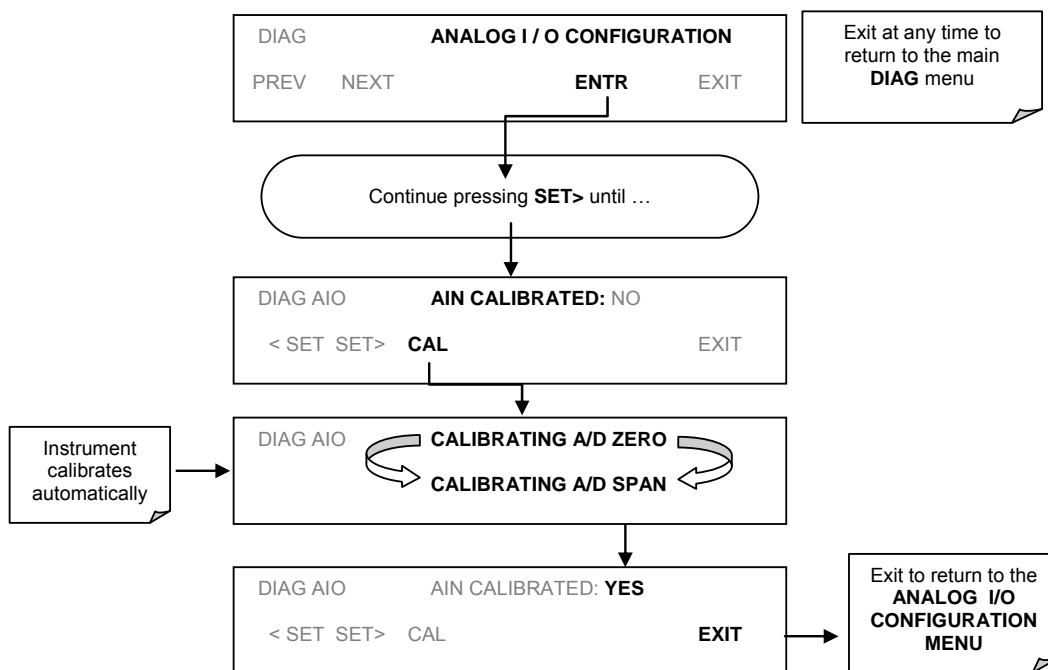

Figure 11-7: DIAG – Analog I/O Configuration – AIN Calibration

Analog Inputs (XIN1...XIN8) Option Configuration

To configure the analyzer's optional analog inputs define for each channel:

- gain (number of units represented by 1 volt)
- offset (volts)
- engineering units to be represented in volts (each press of the touchscreen button scrolls the list of alphanumeric characters from A-Z and 0-9)
- whether to display the channel in the Test functions

To adjust settings for the Analog Input option parameters press:

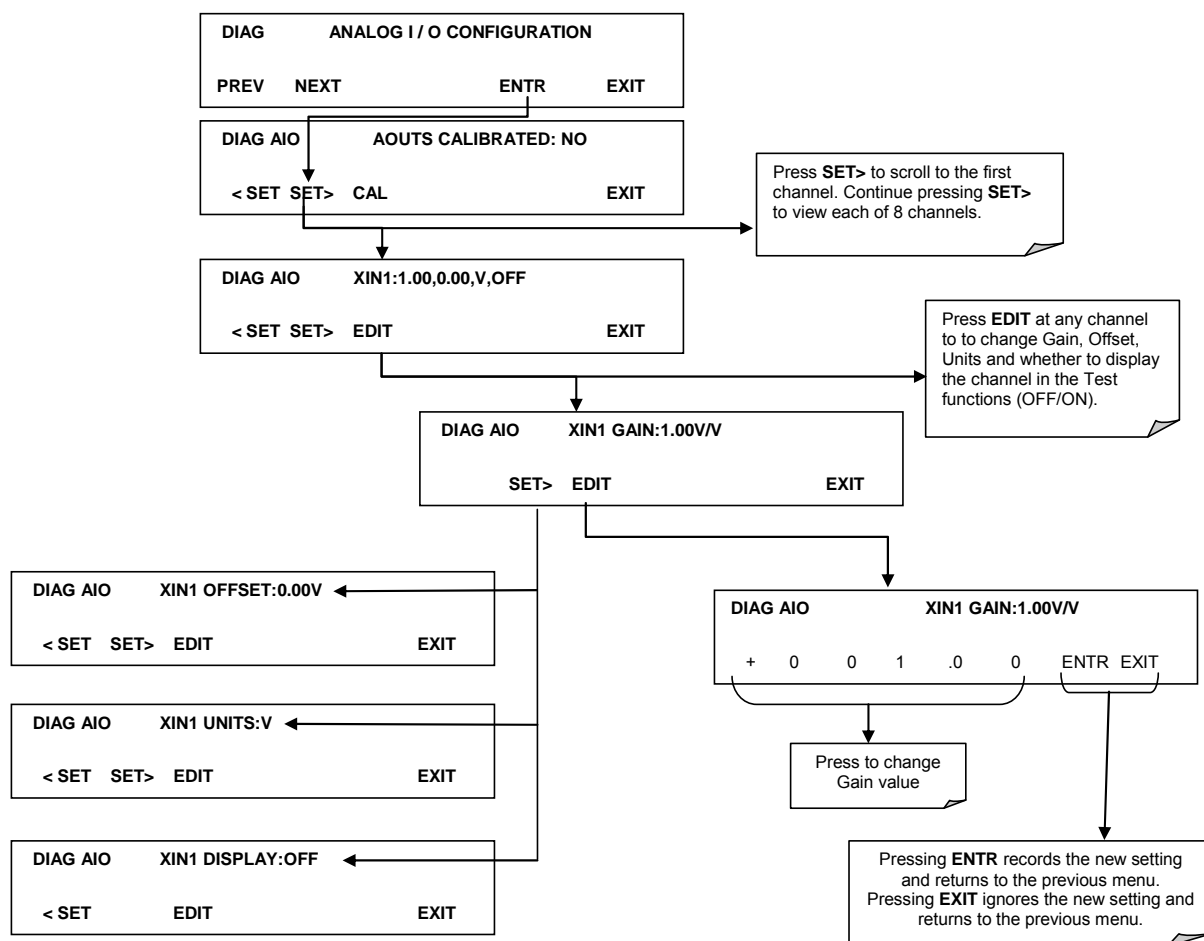

Figure 11-8 DIAG – Analog Inputs (Option) Configuration Menu

USB Configuration

After connecting a USB cable between your PC and the instrument, ensure their baud rates match (change the baud rate setting for either your PC’s software or the instrument). COM2 is the default setup menu for USB configuration.

Also, while there are various communication modes available, the default settings are recommended for USB, except to change the baud rate if desired.

Your computer may need the correct drivers in order to communicate via the USB port. These drivers will be available on TAPI’s website in the near future. You can contact API customer service if you need the drivers and instructions before then. Once the drivers are installed, the instrument’s USB port should work as a standard COM2 port.

Firmware Updates via USB

The T series analyzers can receive firmware updates using a flash drive and the USB ports on the front panel. To update the firmware, locate the file you want to use for the update, and rename it to “update.exe” and copy to the flash drive. This file must not be in a folder on your flash drive in order to be recognized by the T series instrument. Plug in the flash drive and the instrument will give you a popup message with the model the firmware is intended for and the version of firmware, the analyzer will ask if you wish to continue, press yes to continue.

Warning, the instrument will load any recognizable firmware you tell it to regardless of if it is intended for that instrument or not. Double check the firmware model and version before selecting continue.

Troubleshooting faults

Touch-screen Interface

Verify the functioning of the touch screen by observing the display when pressing a touch-screen control button. Assuming that there are no wiring problems and that the DC power supplies are operating properly, but pressing a control button on the touch screen does not change the display, any of the following may be the problem:

- The touch-screen controller may be malfunctioning.
- The internal USB bus may be malfunctioning.

You can verify this failure by logging on to the instrument using APICOM or a terminal program. If the analyzer responds to remote commands and the display changes accordingly, the touch-screen interface may be faulty.

LCD Display Module

Verify the functioning of the front panel display by observing it when power is applied to the instrument. Assuming that there are no wiring problems and that the DC power supplies are operating properly, the display screen should light and show the splash screen and other indications of its state as the CPU goes through its initialization

Touch-screen not working correctly

If you experience problems where the display reacts to touch in a different location to where you are pressing, you may need to re-calibrate the touch-screen. Also, if you are in the touch-screen calibration mode and press cancel at the end of the calibration sequence, you will lose the previous calibration and the display will be mis-calibrated. To correct this, follow the calibration procedure in the Display Calibration section.
